NCERT Solutions for Class 10 Maths Unit 8

Introduction to Trigonometry Class 10

Unit 8 Introduction to Trigonometry Exercise 8.1, 8.2, 8.3, 8.4 Solutions

Exercise 8.1: Solutions of Questions on Page Number: 181

Q1:

In ΔABC right angled at B, AB = 24 cm, BC = 7 m. Determine

- (i) sin A, cos A
- (ii) sin C, cos C

Answer:

Applying Pythagoras theorem for ΔABC , we obtain

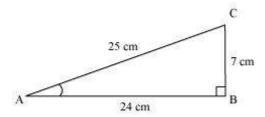

$$AC^2 = AB^2 + BC^2$$

$$= (24 \text{ cm})^2 + (7 \text{ cm})^2$$

$$= (576 + 49) \text{ cm}^2$$

= 625 cm²

$$\therefore AC = \sqrt{625} \text{ cm} = 25 \text{ cm}$$

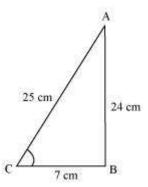

(i)
$$\sin A = \frac{\text{Side opposite to } \angle A}{\text{Hypotenuse}} = \frac{BC}{AC}$$

$$=\frac{7}{25}$$

$$\cos A = \frac{\text{Side adjacent to } \angle A}{\text{Hypotenuse}} = \frac{AB}{AC} = \frac{24}{25}$$

(ii)

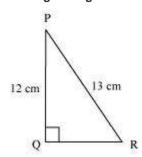

$$\sin C = \frac{\text{Side opposite to } \angle C}{\text{Hypotenuse}} = \frac{AB}{AC}$$
24

$$\cos C = \frac{\text{Side adjacent to } \angle C}{\text{Hypotenuse}} = \frac{BC}{AC}$$

Q2:

In the given figure find tan P - cot R

Answer:

Applying Pythagoras theorem for ΔPQR , we obtain

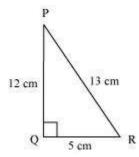

$$PR^2 = PQ^2 + QR^2$$

$$(13 \text{ cm})^2 = (12 \text{ cm})^2 + QR^2$$

$$169 \text{ cm}^2 = 144 \text{ cm}^2 + QR^2$$

$$25 \text{ cm}^2 = QR^2$$

$$QR = 5 cm$$

$$\tan P = \frac{\text{Side opposite to } \angle P}{\text{Side adjacent to } \angle P} = \frac{QR}{PQ}$$

$$= \frac{5}{12}$$

$$\cot R = \frac{\text{Side adjacent to } \angle R}{\text{Side opposite to } \angle R} = \frac{QR}{PQ}$$

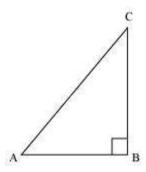

$$= \frac{5}{12}$$

$$\frac{5}{\tan P - \cot R} = \frac{5}{12} - \frac{5}{12} = 0$$

Q3:

Answer:

Let ΔABC be a right-angled triangle, right-angled at point B.

Given that,

$$\sin A = \frac{3}{4}$$

$$\frac{BC}{AC} = \frac{3}{4}$$

Let BC be 3k. Therefore, AC will be 4k, where k is a positive integer.

Applying Pythagoras theorem in ΔABC , we obtain

$$AC^2 = AB^2 + BC^2$$

$$(4k)^2 = AB^2 + (3k)^2$$

$$16k^2 - 9k^2 = AB^2$$

$$7k^2 = AB^2$$

$$AB = \sqrt{7}k$$

$$\cos A = \frac{\text{Side adjacent to } \angle A}{\text{Hypotenuse}}$$

$$= \frac{AB}{AC} = \frac{\sqrt{7k}}{4k} = \frac{\sqrt{7}}{4}$$

$$\tan A = \frac{\text{Side opposite to } \angle A}{\text{Side adjacent to } \angle A}$$

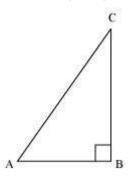

$$= \frac{BC}{AB} = \frac{3k}{\sqrt{7}k} = \frac{3}{\sqrt{7}}$$

Q4:

Given 15 cot A = 8. Find sin A and sec A

Answer:

Consider a right-angled triangle, right-angled at B.

$$\cot A = \frac{\text{Side adjacent to } \angle A}{\text{Side opposite to } \angle A}$$
$$= \frac{AB}{BC}$$

It is given that,

$$\cot A = \frac{8}{15}$$

$$\frac{AB}{BC} = \frac{8}{15}$$

Let AB be 8k. Therefore, BC will be 15k, where k is a positive integer.

Applying Pythagoras theorem in $\triangle ABC$, we obtain

$$AC^2 = AB^2 + BC^2$$

$$= (8k)^2 + (15k)^2$$

$$=64k^2+225k^2$$

$$=289k^{2}$$

$$AC = 17k$$

$$\sin A = \frac{\text{Side opposite to } \angle A}{\text{Hypotenuse}} = \frac{BC}{AC}$$

$$= \frac{15k}{17k} = \frac{15}{17}$$

$$\sec A = \frac{\text{Hypotenuse}}{\text{Side adjacent to } \angle A}$$

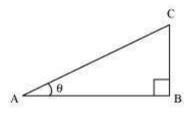

$$= \frac{AC}{AB} = \frac{17}{8}$$

Q5:

Given $\sec \theta = \overline{12}$, calculate all other trigonometric ratios.

Answer:

Consider a right-angle triangle $\triangle ABC$, right-angled at point B.

$$sec\theta = \frac{Hypotenuse}{Side adjacent to ∠θ}$$

$$\frac{13}{12} = \frac{AC}{AB}$$

If AC is 13k, AB will be 12k, where k is a positive integer.

Applying Pythagoras theorem in ΔABC, we obtain

$$(AC)^2 = (AB)^2 + (BC)^2$$

$$(13k)^2 = (12k)^2 + (BC)^2$$

$$169k^2 = 144k^2 + BC^2$$

$$25k^2 = BC^2$$

$$BC = 5k$$

$$\sin \theta = \frac{\text{Side opposite to } \angle \theta}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{5k}{13k} = \frac{5}{13}$$

$$\cos \theta = \frac{\text{Side adjacent to } \angle \theta}{\text{Hypotenuse}} = \frac{\text{AB}}{\text{AC}} = \frac{12k}{13k} = \frac{12}{13}$$

$$\tan \theta = \frac{\text{Side opposite to } \angle \theta}{\text{Side adjacent to } \angle \theta} = \frac{BC}{AB} = \frac{5k}{12k} = \frac{5}{12}$$

$$\cot \theta = \frac{\text{Side adjacent to } \angle \theta}{\text{Side opposite to } \angle \theta} = \frac{AB}{BC} = \frac{12k}{5k} = \frac{12}{5}$$

$$\cos ec \ \theta = \frac{\text{Hypotenuse}}{\text{Side opposite to } \angle \theta} = \frac{\text{AC}}{\text{BC}} = \frac{13k}{5k} = \frac{13}{5}$$

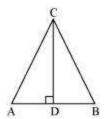

Q6:

If \angle A and \angle B are acute angles such that \cos A = \cos B, then show that

$$\angle A = \angle B$$
.

Answer:

Let us consider a triangle ABC in which CD \(\pm \) AB.

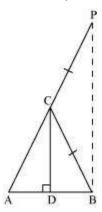

It is given that

$$\cos A = \cos B$$

$$\Rightarrow \frac{AD}{AC} = \frac{BD}{BC} \dots (1)$$

We have to prove $\angle A = \angle B$. To prove this, let us extend AC to P such that BC = CP.

From equation (1), we obtain

$$\frac{AD}{BD} = \frac{AC}{BC}$$

$$\Rightarrow \frac{AD}{BD} = \frac{AC}{CP}$$
(By construction, we have BC = CP) ... (2)

By using the converse of B.P.T,

 $\mathsf{CD}||\mathsf{BP}$

 $\Rightarrow \angle ACD = \angle CPB$ (Corresponding angles) ... (3)

And, $\angle BCD = \angle CBP$ (Alternate interior angles) ... (4)

By construction, we have BC = CP.

 \therefore \angle CBP = \angle CPB (Angle opposite to equal sides of a triangle) ... (5)

From equations (3), (4), and (5), we obtain

$$\angle ACD = \angle BCD \dots (6)$$

In ΔCAD and ΔCBD,

 $\angle ACD = \angle BCD$ [Using equation (6)]

 \angle CDA = \angle CDB [Both 90°]

Therefore, the remaining angles should be equal.

$$\Rightarrow \angle A = \angle B$$

Alternatively,

Let us consider a triangle ABC in which CD \perp AB.

It is given that,

 $\cos A = \cos B$

$$\Rightarrow \frac{AD}{AC} = \frac{BD}{BC}$$

$$\Rightarrow \frac{AD}{BD} = \frac{AC}{BC}$$

$$\frac{AD}{BD} = \frac{AC}{BC} = k$$

$$\Rightarrow$$
 AD = k BD ... (1)

And,
$$AC = k BC \dots (2)$$

Using Pythagoras theorem for triangles CAD and CBD, we obtain

$$CD^2 = AC^2 - AD^2 ... (3)$$

And,
$$CD^2 = BC^2 - BD^2 ... (4)$$

From equations (3) and (4), we obtain

$$AC^2 - AD^2 = BC^2 - BD^2$$

$$\Rightarrow$$
 $(k BC)^2 - (k BD)^2 = BC^2 - BD^2$

$$\Rightarrow k^2 (BC^2 - BD^2) = BC^2 - BD^2$$

$$\Rightarrow k^2 = 1$$

$$\Rightarrow k = 1$$

Putting this value in equation (2), we obtain

$$AC = BC$$

 $\Rightarrow \angle A = \angle B(Angles opposite to equal sides of a triangle)$

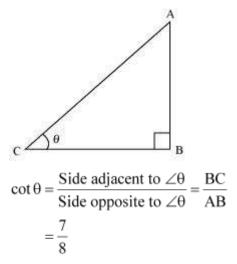

Q7:

If
$$\cot \theta = \frac{7}{8}$$
, evaluate

(i)
$$\frac{\left(1+\sin\theta\right)\left(1-\sin\theta\right)}{\left(1+\cos\theta\right)\left(1-\cos\theta\right)} \text{ (ii) } \cot^2\theta$$

Answer:

Let us consider a right triangle ABC, right-angled at point B.

If BC is 7k, then AB will be 8k, where k is a positive integer.

Applying Pythagoras theorem in ΔABC , we obtain

$$AC^{2} = AB^{2} + BC^{2}$$

$$= (8k)^{2} + (7k)^{2}$$

$$= 64k^{2} + 49k^{2}$$

$$= 113k^{2}$$

$$AC = \sqrt{113}k$$

$$\sin \theta = \frac{\text{Side opposite to } \angle \theta}{\text{Hypotenuse}} = \frac{AB}{AC}$$

$$= \frac{8k}{\sqrt{113}k} = \frac{8}{\sqrt{113}}$$

$$\cos \theta = \frac{\text{Side adjacent to } \angle \theta}{\text{Hypotenuse}} = \frac{BC}{AC}$$

$$= \frac{7k}{\sqrt{113}k} = \frac{7}{\sqrt{113}}$$

$$\frac{(1+\sin\theta)(1-\sin\theta)}{(1+\cos\theta)(1-\cos\theta)} = \frac{(1-\sin^{2}\theta)}{(1-\cos^{2}\theta)}$$
(i)

$$=\frac{1-\left(\frac{8}{\sqrt{113}}\right)^2}{1-\left(\frac{7}{\sqrt{113}}\right)^2}=\frac{1-\frac{64}{113}}{1-\frac{49}{113}}$$

$$=\frac{\frac{49}{113}}{\frac{64}{113}} = \frac{49}{64}$$

(ii)
$$\cot^2 \theta = (\cot \theta)^2 = \left(\frac{7}{8}\right)^2 = \frac{49}{64}$$

Q8:

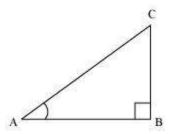

$$\frac{1-\tan^2 A}{1+\tan^2 A} = \cos^2 A - \sin^2 A \text{ or not.}$$
 If 3 cot A = 4, Check whether

Answer:

It is given that $3\cot A = 4$

Or, cot A =
$$\frac{4}{3}$$

Consider a right triangle ABC, right-angled at point B.

$$\cot A = \frac{\text{Side adjacent to } \angle A}{\text{Side opposite to } \angle A}$$

$$\frac{AB}{BC} = \frac{4}{3}$$

If AB is 4k, then BC will be 3k, where k is a positive integer.

In ΔABC,

$$(AC)^2 = (AB)^2 + (BC)^2$$

= $(4k)^2 + (3k)^2$

$$= 16k^2 + 9k^2$$

$$=25k^{2}$$

$$AC = 5k$$

$$AC = 5k$$

$$\cos A = \frac{\text{Side adjacent to } \angle A}{\text{Hypotenuse}} = \frac{AB}{AC}$$

$$= \frac{4k}{5k} = \frac{4}{5}$$

$$\sin A = \frac{\text{Side opposite to } \angle A}{\text{Hypotenuse}} = \frac{BC}{AC}$$

$$= \frac{3k}{5k} = \frac{3}{5}$$

$$\tan A = \frac{\text{Side opposite to } \angle A}{\text{Hypotenuse}} = \frac{BC}{AB}$$

$$= \frac{3k}{4k} = \frac{3}{4}$$

$$\frac{1-\tan^2 A}{1+\tan^2 A} = \frac{1-\left(\frac{3}{4}\right)^2}{1+\left(\frac{3}{4}\right)^2} = \frac{1-\frac{9}{16}}{1+\frac{9}{16}}$$
$$= \frac{\frac{7}{16}}{\frac{25}{16}} = \frac{7}{25}$$

$$\cos^2 A - \sin^2 A = \left(\frac{4}{5}\right)^2 - \left(\frac{3}{5}\right)^2$$

$$= \frac{16}{25} - \frac{9}{25} = \frac{7}{25}$$

$$1 - \tan^2 A$$

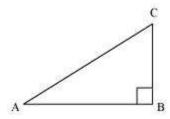

$$\frac{1-\tan^2 A}{1+\tan^2 A} = \cos^2 A - \sin^2 A$$

Q9:

$$tan \; A = \frac{1}{\sqrt{3}} \; , \; \mbox{find the value of} \;$$
 In $\Delta \mbox{ABC}, \; \mbox{right angled at B. If} \;$

- (i) sin A cos C + cos A sin C
- (ii) cos A cos C sin A sin C

Answer:

$$\tan A = \frac{1}{\sqrt{3}}$$

$$\frac{BC}{AB} = \frac{1}{\sqrt{3}}$$

If BC is k, then AB will be $\sqrt{3}k$, where k is a positive integer. In Δ ABC,

 $AC^2 = AB^2 + BC^2$

$$= \left(\sqrt{3}k\right)^2 + \left(k\right)^2$$

$$=3k^2+k^2=4k^2$$

$$\therefore AC = 2k$$

$$\sin A = \frac{\text{Side opposite to } \angle A}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{k}{2k} = \frac{1}{2}$$

$$\cos A = \frac{\text{Side adjacent to } \angle A}{\text{Hypotenuse}} = \frac{AB}{AC} = \frac{\sqrt{3}k}{2k} = \frac{\sqrt{3}}{2}$$

$$\sin C = \frac{\text{Side opposite to } \angle C}{\text{Hypotenuse}} = \frac{AB}{AC} = \frac{\sqrt{3}k}{2k} = \frac{\sqrt{3}}{2}$$

$$\cos C = \frac{\text{Side adjacent to } \angle C}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{k}{2k} = \frac{1}{2}$$

(i) sin A cos C + cos A sin C

$$= \left(\frac{1}{2}\right) \left(\frac{1}{2}\right) + \left(\frac{\sqrt{3}}{2}\right) \left(\frac{\sqrt{3}}{2}\right) = \frac{1}{4} + \frac{3}{4}$$
$$= \frac{4}{4} = 1$$

$$= \left(\frac{\sqrt{3}}{2}\right) \left(\frac{1}{2}\right) - \left(\frac{1}{2}\right) \left(\frac{\sqrt{3}}{2}\right) = \frac{\sqrt{3}}{4} - \frac{\sqrt{3}}{4} = 0$$

Q10:

In ΔPQR, right angled at Q, PR + QR = 25 cm and PQ = 5 cm. Determine the values of sin P, cos P and tan P.

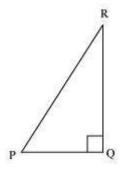

Answer:

Given that, PR + QR = 25

PQ = 5

Let PR be x.

Therefore, QR = 25 - x

Applying Pythagoras theorem in ΔPQR, we obtain

$$PR^2 = PQ^2 + QR^2$$

$$x^2 = (5)^2 + (25 - x)^2$$

$$x^2 = 25 + 625 + x^2 - 50x$$

50x = 650

$$x = 13$$

Therefore, PR = 13 cm

$$QR = (25 - 13) cm = 12 cm$$

$$\sin P = \frac{\text{Side opposite to } \angle P}{\text{Hypotenuse}} = \frac{QR}{PR} = \frac{12}{13}$$

$$\cos P = \frac{\text{Side adjacent to } \angle P}{\text{Hypotenuse}} = \frac{PQ}{PR} = \frac{5}{13}$$

$$\tan P = \frac{\text{Side opposite to } \angle P}{\text{Side adjacent to } \angle P} = \frac{QR}{PQ} = \frac{12}{5}$$

Q11:

State whether the following are true or false. Justify your answer.

(i) The value of tan A is always less than 1.

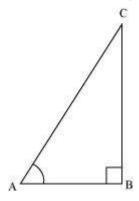

(ii) sec A =
$$\frac{12}{5}$$
 for some value of angle A.

- (iii) cos A is the abbreviation used for the cosecant of angle A.
- (iv) cot A is the product of cot and A

$$\frac{4}{3}$$
 (v) $\sin \theta = \frac{3}{3}$, for some angle θ

Answer:

(i) Consider a \triangle ABC, right-angled at B.

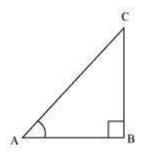

$$\tan A = \frac{\text{Side opposite to } \angle A}{\text{Side adjacent to } \angle A}$$
$$-\frac{12}{}$$

$$\frac{12}{5} > 1$$

So, tan A < 1 is not always true.

Hence, the given statement is false.

$$\sec A = \frac{12}{5}$$

$$\frac{\text{Hypotenuse}}{\text{Side adjacent to } \angle A} = \frac{12}{5}$$

$$\frac{AC}{AB} = \frac{12}{5}$$

Let AC be 12k, AB will be 5k, where k is a positive integer.

Applying Pythagoras theorem in ΔABC , we obtain

$$AC^2 = AB^2 + BC^2$$

$$(12k)^2 = (5k)^2 + BC^2$$

$$144k^2 = 25k^2 + BC^2$$

$$BC^2 = 119k^2$$

$$BC = 10.9k$$

It can be observed that for given two sides AC = 12k and AB = 5k,

BC should be such that,

$$12k - 5k < BC < 12k + 5k$$

However, BC = 10.9k. Clearly, such a triangle is possible and hence, such value of sec A is possible.

Hence, the given statement is true.

(iii) Abbreviation used for cosecant of angle A is cosec A. And cos A is the abbreviation used for cosine of angle A.

Hence, the given statement is false.

(iv) cot A is not the product of cot and A. It is the cotangent of $\angle A$.

Hence, the given statement is false.

$$(v) \sin \theta = \frac{4}{3}$$

We know that in a right-angled triangle,

$$\sin \theta = \frac{\text{Side opposite to } \angle \theta}{\text{Hypotenuse}}$$

In a right-angled triangle, hypotenuse is always greater than the remaining two sides. Therefore, such value of $\sin \theta$ is not possible.

Exercise 8.2: Solutions of Questions on Page Number: 187

Q1

Evaluate the following

(i) sin60° cos30° + sin30° cos 60°

$$\sin 30^{\circ} + \tan 45^{\circ} - \csc 60^{\circ}$$

(iv)
$$\sec 30^{\circ} + \cos 60^{\circ} + \cot 45^{\circ}$$

(v)
$$\frac{5\cos^2 60^\circ + 4\sec^2 30^\circ - \tan^2 45^\circ}{\sin^2 30^\circ + \cos^2 30^\circ}$$

Answer:

(i) sin60° cos30° + sin30° cos 60°

$$= \left(\frac{\sqrt{3}}{2}\right) \left(\frac{\sqrt{3}}{2}\right) + \left(\frac{1}{2}\right) \left(\frac{1}{2}\right)$$
$$= \frac{3}{4} + \frac{1}{4} = \frac{4}{4} = 1$$

(ii) 2tan245° + cos230° - sin260°

$$= 2(1)^{2} + \left(\frac{\sqrt{3}}{2}\right)^{2} - \left(\frac{\sqrt{3}}{2}\right)^{2}$$
$$= 2 + \frac{3}{4} - \frac{3}{4} = 2$$

$$\frac{\cos 45^{\circ}}{\sec 30^{\circ} + \csc 30^{\circ}}$$

$$= \frac{\frac{1}{\sqrt{2}}}{\frac{2}{\sqrt{3}} + 2} = \frac{\frac{1}{\sqrt{2}}}{\frac{2 + 2\sqrt{3}}{\sqrt{3}}}$$

$$= \frac{\sqrt{3}}{\sqrt{2}(2 + 2\sqrt{3})} = \frac{\sqrt{3}}{2\sqrt{2} + 2\sqrt{6}}$$

$$= \frac{\sqrt{3}(2\sqrt{6} - 2\sqrt{2})}{(2\sqrt{6} + 2\sqrt{2})(2\sqrt{6} - 2\sqrt{2})}$$

$$= \frac{2\sqrt{3}(\sqrt{6} - \sqrt{2})}{(2\sqrt{6})^2 - (2\sqrt{2})^2} = \frac{2\sqrt{3}(\sqrt{6} - \sqrt{2})}{24 - 8} = \frac{2\sqrt{3}(\sqrt{6} - \sqrt{2})}{16}$$

$$= \frac{\sqrt{18} - \sqrt{6}}{8} = \frac{3\sqrt{2} - \sqrt{6}}{8}$$

$$= \frac{\sin 30^\circ + \tan 45^\circ - \csc 60^\circ}{\sec 30^\circ + \cos 60^\circ + \cot 45^\circ}$$

$$= \frac{\frac{1}{2} + 1 - \frac{2}{\sqrt{3}}}{\frac{2}{\sqrt{3}} + \frac{1}{2} + 1} = \frac{\frac{3}{2} - \frac{2}{\sqrt{3}}}{\frac{3}{2} + \frac{2}{\sqrt{3}}}$$

$$=\frac{\frac{3\sqrt{3}-4}{2\sqrt{3}}}{\frac{3\sqrt{3}+4}{2\sqrt{3}}} = \frac{\left(3\sqrt{3}-4\right)}{\left(3\sqrt{3}+4\right)}$$

$$= \frac{\left(3\sqrt{3} - 4\right)\left(3\sqrt{3} - 4\right)}{\left(3\sqrt{3} + 4\right)\left(3\sqrt{3} - 4\right)} = \frac{\left(3\sqrt{3} - 4\right)^2}{\left(3\sqrt{3}\right)^2 - \left(4\right)^2}$$

$$=\frac{27+16-24\sqrt{3}}{27-16}=\frac{43-24\sqrt{3}}{11}$$

(v)
$$\frac{5\cos^2 60^\circ + 4\sec^2 30^\circ - \tan^2 45^\circ}{\sin^2 30^\circ + \cos^2 30^\circ}$$

$$= \frac{5\left(\frac{1}{2}\right)^2 + 4\left(\frac{2}{\sqrt{3}}\right)^2 - (1)^2}{\left(\frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2}$$

$$=\frac{5\left(\frac{1}{4}\right) + \left(\frac{16}{3}\right) - 1}{\frac{1}{4} + \frac{3}{4}}$$

$$=\frac{\frac{15+64-12}{12}}{\frac{4}{4}}=\frac{67}{12}$$

Q2:

Choose the correct option and justify your choice.

$$\frac{2 \tan 30^{\circ}}{1 + \tan^2 30^{\circ}} =$$

- (A). sin60°
- (B). cos60°
- (C). tan60°
- (D). sin30°

$$\frac{1-\tan^2 45^\circ}{1+\tan^2 45^\circ} =$$

- (A). tan90°
- (B). 1
- (C). sin45°
- (D). 0
- (iii) sin2A = 2sinA is true when A =
- (A). 0°
- (B). 30°
- (C). 45°
- (D). 60°

$$\frac{2 \tan 30^{\circ}}{1 - \tan^2 30^{\circ}} =$$

Answer:

$$\frac{2 \tan 30^{\circ}}{1 + \tan^2 30^{\circ}}$$

$$= \frac{2\left(\frac{1}{\sqrt{3}}\right)}{1 + \left(\frac{1}{\sqrt{3}}\right)^2} = \frac{\frac{2}{\sqrt{3}}}{1 + \frac{1}{3}} = \frac{\frac{2}{\sqrt{3}}}{\frac{4}{3}}$$
$$= \frac{6}{4\sqrt{3}} = \frac{\sqrt{3}}{2}$$

$$\sin 60^\circ = \frac{\sqrt{3}}{2}$$

Out of the given alternatives, only

Hence, (A) is correct.

$$\frac{1 - \tan^2 45^\circ}{1 + \tan^2 45^\circ}$$

$$=\frac{1-\left(1\right)^{2}}{1+\left(1\right)^{2}}=\frac{1-1}{1+1}=\frac{0}{2}=0$$

Hence, (D) is correct.

(iii)Out of the given alternatives, only A = 0° is correct.

As
$$\sin 2A = \sin 0^{\circ} = 0$$

$$2 \sin A = 2 \sin 0^{\circ} = 2(0) = 0$$

Hence, (A) is correct.

$$\frac{2 \tan 30^{\circ}}{1 - \tan^2 30^{\circ}}$$

$$=\frac{2\left(\frac{1}{\sqrt{3}}\right)}{1-\left(\frac{1}{\sqrt{3}}\right)^2} = \frac{\frac{2}{\sqrt{3}}}{1-\frac{1}{3}} = \frac{\frac{2}{\sqrt{3}}}{\frac{2}{3}}$$

$$=\sqrt{3}$$

Out of the given alternatives, only tan $60^{\circ} = \sqrt{3}$

Hence, (C) is correct.

Q3:

If
$$\tan(A+B) = \sqrt{3} \tan(A-B) = \frac{1}{\sqrt{3}}$$
;

 0° < A + B \leq 90°, A > B find A and B.

Answer:

$$\tan(A+B) = \sqrt{3}$$

$$\tan (A + B) = \tan 60$$

$$\Rightarrow$$
 A + B = 60 ... (1)

$$\tan\left(\mathbf{A} - \mathbf{B}\right) = \frac{1}{\sqrt{3}}$$

$$\Rightarrow$$
 tan (A - B) = tan30

$$\Rightarrow$$
 A - B = 30 ... (2)

On adding both equations, we obtain

$$2A = 90$$

$$\Rightarrow$$
 A = 45

From equation (1), we obtain

$$45 + B = 60$$

$$B = 15$$

Therefore, $\angle A = 45^{\circ}$ and $\angle B = 15^{\circ}$

Q4:

State whether the following are true or false. Justify your answer.

- (i) sin(A + B) = sin A + sin B
- (ii) The value of sinθincreases as θincreases
- (iii) The value of cos θincreases as θincreases
- (iv) sinÃŽÂ, = cos ÃŽÂ, for all values of ÃŽÂ,
- (v) cot A is not defined for $A = 0^{\circ}$

Answer:

(i)
$$sin(A + B) = sin A + sin B$$

Let A =
$$30^{\circ}$$
 and B = 60°

$$\sin (A + B) = \sin (30^{\circ} + 60^{\circ})$$

$$\sin A + \sin B = \sin 30^{\circ} + \sin 60^{\circ}$$

$$=\frac{1}{2}+\frac{\sqrt{3}}{2}=\frac{1+\sqrt{3}}{2}$$

Hence, the given statement is false.

(ii) The value of sin θ increases as θ increases in the interval of $0^\circ < \theta < 90^\circ$ as

$$\sin 0^{\circ} = 0$$

$$\sin 30^\circ = \frac{1}{2} = 0.5$$

$$\sin 45^\circ = \frac{1}{\sqrt{2}} = 0.707$$

$$\sin 60^\circ = \frac{\sqrt{3}}{2} = 0.866$$

$$\sin 90^{\circ} = 1$$

Hence, the given statement is true.

(iii)
$$\cos 0^{\circ} = 1$$

$$\cos 30^{\circ} = \frac{\sqrt{3}}{2} = 0.866$$

$$\cos 45^\circ = \frac{1}{\sqrt{2}} = 0.707$$

$$\cos 60^{\circ} = \frac{1}{2} = 0.5$$

$$\cos 90^{\circ} = 0$$

It can be observed that the value of $\cos\theta$ does not increase in the interval of $0^{\circ} < \theta < 90^{\circ}$.

Hence, the given statement is false.

(iv) $\sin \theta = \cos \theta$ for all values of θ .

This is true when $\theta = 45^{\circ}$

$$\sin 45^\circ = \frac{1}{\sqrt{2}}$$

$$\cos 45^\circ = \frac{1}{\sqrt{2}}$$

It is not true for all other values of θ .

As
$$\sin 30^{\circ} = \frac{1}{2}$$
 and $\cos 30^{\circ} = \frac{\sqrt{3}}{2}$

Hence, the given statement is false.

(v) cot A is not defined for $A = 0^{\circ}$

$$\cot A = \frac{\cos A}{\sin A},$$

$$\cot 0^{\circ} = \frac{\cos 0^{\circ}}{\sin 0^{\circ}} = \frac{1}{0}$$
 = undefined

Hence, the given statement is true.

Exercise 8.3: Solutions of Questions on Page Number: 189

Q1:

Evaluate

Answer:

$$\frac{\sin 18^{\circ}}{\cos 72^{\circ}} = \frac{\sin (90^{\circ} - 72^{\circ})}{\cos 72^{\circ}}$$
$$= \frac{\cos 72^{\circ}}{\cos 72^{\circ}} = 1$$

$$\frac{\tan 26^{\circ}}{\cot 64^{\circ}} = \frac{\tan \left(90^{\circ} - 64^{\circ}\right)}{\cot 64^{\circ}}$$

```
= \frac{\cot 64^{\circ}}{\cot 64^{\circ}} = 1
(III)cos 48° - sin 42° = cos (90° - 42°) - sin 42°
= sin 42° - sin 42°
= 0
(IV) cosec 31° - sec 59° = cosec (90° - 59°) - sec 59°
= sec 59° - sec 59°
= 0
```

Q2:

Show that

(I) tan 48° tan 23° tan 42° tan 67° = 1

(II) $\cos 38^{\circ} \cos 52^{\circ} - \sin 38^{\circ} \sin 52^{\circ} = 0$

Answer:

```
(I) tan 48° tan 23° tan 42° tan 67°

= tan (90° - 42°) tan (90° - 67°) tan 42° tan 67°

= cot 42° cot 67° tan 42° tan 67°

= (cot 42° tan 42°) (cot 67° tan 67°)

= (1) (1)

= 1

(II) cos 38° cos 52° - sin 38° sin 52°

= cos (90° - 52°) cos (90° - 38°) - sin 38° sin 52°

= sin 52° sin 38° - sin 38° sin 52°

= 0
```

Q3:

If $tan 2A = cot (A-18^\circ)$, where 2A is an acute angle, find the value of A.

Answer:

Given that,

$$tan 2A = cot (A- 18^\circ)$$

$$\cot (90^{\circ} - 2A) = \cot (A - 18^{\circ})$$

$$90^{\circ} - 2A = A - 18^{\circ}$$

$$A = 36^{\circ}$$

Q4:

If tan A = cot B, prove that $A + B = 90^{\circ}$

Answer:

Given that,

tan A = cot B

 $tan A = tan (90^{\circ} - B)$

$$A = 90^{\circ} - B$$

$$A + B = 90^{\circ}$$

Q5:

If sec 4A = cosec (A- 20°), where 4A is an acute angle, find the value of A.

Answer:

Given that,

$$sec 4A = cosec (A - 20^{\circ})$$

$$cosec (90^{\circ} - 4A) = cosec (A - 20^{\circ})$$

$$110^{\circ} = 5A$$

Q6:

If A, Band C are interior angles of a triangle ABC then show that

$$\sin\left(\frac{B+C}{2}\right) = \cos\frac{A}{2}$$

Answer:

We know that for a triangle ABC,

$$\angle$$
 A + \angle B + \angle C = 180°

$$\frac{\angle B + \angle C}{2} = 90^{\circ} - \frac{\angle A}{2}$$
$$\sin\left(\frac{B + C}{2}\right) = \sin\left(90^{\circ} - \frac{A}{2}\right)$$
$$= \cos\left(\frac{A}{2}\right)$$

Q7:

Express sin 67° + cos 75° in terms of trigonometric ratios of angles between 0° and 45°.

Answer:

 $\sin 67^{\circ} + \cos 75^{\circ}$

$$= \sin (90^{\circ} - 23^{\circ}) + \cos (90^{\circ} - 15^{\circ})$$

$$= \cos 23^{\circ} + \sin 15^{\circ}$$

Exercise 8.4: Solutions of Questions on Page Number: 193

Q1:

Express the trigonometric ratios sin A, sec A and tan A in terms of cot A.

Answer:

We know that,

$$\csc^2 A = 1 + \cot^2 A$$

$$\frac{1}{\operatorname{cosec}^2 A} = \frac{1}{1 + \cot^2 A}$$

$$\sin^2 A = \frac{1}{1 + \cot^2 A}$$

$$\sin A = \pm \frac{1}{\sqrt{1 + \cot^2 A}}$$

$$\sqrt{1+\cot^2 A}$$
 will always be positive as we are adding two positive quantities.

$$\sin A = \frac{1}{\sqrt{1 + \cot^2 A}}$$

Therefore,

$$\tan A = \frac{\sin A}{\cos A}$$

We know that.

However,
$$\cot A = \frac{\cos A}{\sin A}$$

$$\tan A = \frac{1}{\cot A}$$

$$Also, sec^2 A = 1 + tan^2 A$$

$$= 1 + \frac{1}{\cot^2 A}$$
$$= \frac{\cot^2 A + 1}{\cot^2 A}$$

$$\sec A = \frac{\sqrt{\cot^2 A + 1}}{\cot A}$$

Q2:

Write all the other trigonometric ratios of \angle A in terms of sec A.

Answer:

We know that,

$$\cos A = \frac{1}{\sec A}$$

Also, $\sin^2 A + \cos^2 A = 1$

$$\sin^2 A = 1 - \cos^2 A$$

$$\sin A = \sqrt{1 - \left(\frac{1}{\sec A}\right)^2}$$

$$= \sqrt{\frac{\sec^2 A - 1}{\sec^2 A}} = \frac{\sqrt{\sec^2 A - 1}}{\sec A}$$

$$tan^2A + 1 = sec^2A$$

$$tan^2A = sec^2A - 1$$

$$\tan A = \sqrt{\sec^2 A - 1}$$

$$\cot A = \frac{\cos A}{\sin A} = \frac{\frac{1}{\sec A}}{\frac{\sqrt{\sec^2 A - 1}}{\sec A}}$$

$$= \frac{1}{\sqrt{\sec^2 A - 1}}$$

$$\csc A = \frac{1}{\sin A} = \frac{\sec A}{\sqrt{\sec^2 A - 1}}$$

Q3:

Evaluate

$$\frac{\sin^2 63^\circ + \sin^2 27^\circ}{\cos^2 17^\circ + \cos^2 73^\circ}$$

(ii) sin25° cos65° + cos25° sin65°

Answer:

$$\frac{\sin^2 63^\circ + \sin^2 27^\circ}{\cos^2 17^\circ + \cos^2 73^\circ}$$

$$= \frac{\left[\sin (90^\circ - 27^\circ)\right]^2 + \sin^2 27^\circ}{\left[\cos (90^\circ - 73^\circ)\right]^2 + \cos^2 73^\circ}$$

$$= \frac{\left[\cos 27^\circ\right]^2 + \sin^2 27^\circ}{\left[\sin 73^\circ\right]^2 + \cos^2 73^\circ}$$

$$= \frac{\cos^2 27^\circ + \sin^2 27^\circ}{\sin^2 73^\circ + \cos^2 73^\circ}$$

$$= \frac{1}{1}_{(As \sin^2 A + \cos^2 A = 1)}$$

$$= 1$$
(ii) $\sin 25^\circ \cos 65^\circ + \cos 25^\circ \sin 65^\circ$

$$= (\sin 25^\circ) \left\{\cos (90^\circ - 25^\circ)\right\} + \cos 25^\circ \left\{\sin (90^\circ - 25^\circ)\right\}$$

$$= (\sin 25^\circ) (\sin 25^\circ) + (\cos 25^\circ) (\cos 25^\circ)$$

$$= \sin^2 25^\circ + \cos^2 25^\circ$$

Q4:

Choose the correct option. Justify your choice.

- (i) $9 \sec^2 A 9 \tan^2 A =$
- (A) 1
- (B) 9
- (C) 8
- (D) 0
- (ii) $(1 + \tan \theta + \sec \theta) (1 + \cot \theta \csc \theta)$
- (A) 0
- (B) 1
- (C) 2
- (D) 1
- (iii) (secA + tanA) (1 sinA) =
- (A) secA
- (B) sinA
- (C) cosecA
- (D) cosA

$$\frac{1+\tan^2 A}{1+\cot^2 A}$$

- (A) sec² A
- (B) 1
- (C) cot² A
- (D) tan² A

Answer:

- (i) 9 sec²A 9 tan²A
- = 9 ($sec^2A tan^2A$)
- $= 9 (1) [As sec^2 A tan^2 A = 1]$
- = 9

Hence, alternative (B) is correct.

(ii)

$$(1 + \tan \theta + \sec \theta) (1 + \cot \theta - \csc \theta)$$

$$\begin{split} &= \left(1 + \frac{\sin \theta}{\cos \theta} + \frac{1}{\cos \theta}\right) \left(1 + \frac{\cos \theta}{\sin \theta} - \frac{1}{\sin \theta}\right) \\ &= \left(\frac{\cos \theta + \sin \theta + 1}{\cos \theta}\right) \left(\frac{\sin \theta + \cos \theta - 1}{\sin \theta}\right) \\ &= \frac{\left(\sin \theta + \cos \theta\right)^2 - \left(1\right)^2}{\sin \theta \cos \theta} \\ &= \frac{\sin^2 \theta + \cos^2 \theta + 2\sin \theta \cos \theta - 1}{\sin \theta \cos \theta} \\ &= \frac{1 + 2\sin \theta \cos \theta - 1}{\sin \theta \cos \theta} \\ &= \frac{2\sin \theta \cos \theta}{\sin \theta \cos \theta} = 2 \end{split}$$

Hence, alternative (C) is correct.

$$= \left(\frac{1}{\cos A} + \frac{\sin A}{\cos A}\right) (1 - \sin A)$$
$$= \left(\frac{1 + \sin A}{\cos A}\right) (1 - \sin A)$$
$$= \frac{1 - \sin^2 A}{\cos A} = \frac{\cos^2 A}{\cos A}$$

Hence, alternative (D) is correct.

$$\frac{1 + \tan^{2} A}{1 + \cot^{2} A} = \frac{1 + \frac{\sin^{2} A}{\cos^{2} A}}{1 + \frac{\cos^{2} A}{\sin^{2} A}}$$
(iv)
$$= \frac{\frac{\cos^{2} A + \sin^{2} A}{\sin^{2} A}}{\frac{\cos^{2} A}{\sin^{2} A}} = \frac{\frac{1}{\cos^{2} A}}{\frac{1}{\sin^{2} A}}$$

$$= \frac{\sin^{2} A}{\cos^{2} A} = \tan^{2} A$$

Hence, alternative (D) is correct.

Prove the following identities, where the angles involved are acute angles for which the expressions are defined.

Answer:

$$\begin{aligned} &(\operatorname{cosec}\theta - \cot\theta)^2 = \frac{1 - \cos\theta}{1 + \cos\theta} \\ &L.H.S. = (\operatorname{cose}\theta - \cot\theta)^2 \\ &= \left(\frac{1}{\sin\theta} - \frac{\cos\theta}{\sin\theta}\right)^2 \\ &= \frac{\left(1 - \cos\theta\right)^2}{\left(\sin\theta\right)^2} = \frac{\left(1 - \cos\theta\right)^2}{\sin^2\theta} \\ &= \frac{\left(1 - \cos\theta\right)^2}{1 - \cos^2\theta} = \frac{\left(1 - \cos\theta\right)^2}{\left(1 - \cos\theta\right)\left(1 + \cos\theta\right)} = \frac{1 - \cos\theta}{1 + \cos\theta} \\ &= R.H.S. \\ &\frac{\cos A}{1 + \sin A} + \frac{1 + \sin A}{\cos A} = 2 \sec A \\ &L.H.S. = \frac{\cos A}{1 + \sin A} + \frac{1 + \sin A}{\cos A} \\ &= \frac{\cos^2 A + \left(1 + \sin A\right)^2}{\left(1 + \sin A\right)\left(\cos A\right)} \\ &= \frac{\sin^2 A + \cos^2 A + 1 + 2\sin A}{\left(1 + \sin A\right)\left(\cos A\right)} \\ &= \frac{\sin^2 A + \cos^2 A + 1 + 2\sin A}{\left(1 + \sin A\right)\left(\cos A\right)} \\ &= \frac{1 + 1 + 2\sin A}{\left(1 + \sin A\right)\left(\cos A\right)} = \frac{2 + 2\sin A}{\left(1 + \sin A\right)\left(\cos A\right)} \\ &= \frac{2\left(1 + \sin A\right)}{\left(1 + \sin A\right)\left(\cos A\right)} = \frac{2}{\cos A} = 2 \sec A \end{aligned}$$

$$= R.H.S.$$

$$\frac{\tan\theta}{1-\cot\theta} + \frac{\cot\theta}{1-\tan\theta} = 1 + \sec\theta \csc\theta$$

$$\begin{aligned} \text{L.H.S.} &= \frac{\tan \theta}{1 - \cot \theta} + \frac{\cot \theta}{1 - \tan \theta} \\ &= \frac{\frac{\sin \theta}{\cos \theta}}{1 - \frac{\cos \theta}{\sin \theta}} + \frac{\frac{\cos \theta}{\sin \theta}}{1 - \frac{\sin \theta}{\cos \theta}} \\ &= \frac{\frac{\sin \theta}{\cos \theta}}{\frac{\sin \theta - \cos \theta}{\sin \theta}} + \frac{\frac{\cos \theta}{\sin \theta}}{\frac{\cos \theta - \sin \theta}{\cos \theta}} \\ &= \frac{\frac{\sin^2 \theta}{\cos \theta (\sin \theta - \cos \theta)}}{\frac{\cos \theta}{\cos \theta (\sin \theta - \cos \theta)}} - \frac{\frac{\cos^2 \theta}{\sin \theta (\sin \theta - \cos \theta)}}{\sin \theta (\sin \theta - \cos \theta)} \end{aligned}$$
